

Changing trends of maternal mortality rates in last 26 years at an apex level teaching hospital in Northern Madhya Pradesh

(Mrs) Shaila Sapre • Vrunda Joshi,

Dept. of Obst. & Gyn, Kamala Raja Hospital, Gwalior.

Summary : There is always an element of risk that a Woman has to face in attaining motherhood. Materna mortality rates still remain high in developing countries, and India has set a goal of reducing MMR to 200/1,00,000 live births by the year 2000A.D.

Majority of maternal deaths in developing countries are due to causes which can be avoided by proper utilization of 3 E's i.e essential obstetric care, early detection of complications & efficient emergency services. Review o maternal deaths helps to find out the faults and lacunae at various levels & helps plan out remedial strategies. With this objective a detailed survey of maternal deaths occurring in the dept.of Obstetrics & Gynaecology Kamla Raja Hospital, a over last 26 yrs was done & analyzed. Changing trends in the causes of materna deaths have been focussed & analyzed.

Objectives

To study the epidemiology of maternal deaths regarding causes of death, percentage of booked & unbooked cases, residence & socio-economic status of the women who died.

To compare the variability of above factors in last 26 yrs and their changing trends.

To find out faults & lacunae at various levels of prevention.

Methods

A thorough analysis was done of individual records of all cases of maternal deaths occurring in the dept. Of Obstetrics & Gynaecology, Kamla Raja hospital (KRH), Gwalior from Jan 1971 to Dec 1996. MMR for every year was calculated from the number of maternal deaths and number of live births per year. The causes of death were analysed with special attention to determine the avoidable factors in each maternal death.

Observations

Table I shows the yearwise MMR in dept of Obst & Gyn, K.R.H., Gwalior. There is some decline in MMR from 1971 to 1980. But in later years of the 9th decade and the 10th decade MMR remains similar every year.

Table I
Maternal Mortality per year

| Year | No.of live births | no.of maternal Deaths | MMR/1,00,000 live births. |
|--------------|-------------------|-----------------------|---------------------------|
| 1971 | 2584 | 54 | 2089.78 |
| 1972 | 2517 | 52 | 2026.22 |
| 1973 | 2908 | 45 | 1547.45 |
| 1974 | 3015 | 48 | 1592.04 |
| 1975 | 3112 | 56 | 1799.48 |
| 1976 | 3108 | 52 | 1673.10 |
| 1977 | 2929 | 56 | 1911.91 |
| 1978 | 3115 | 60 | 1920.16 |
| 1979 | 2831 | 57 | 2013.12 |
| 1980 | 2461 | 61 | 2478.66 |
| 1981 | 2686 | 56 | 2084.88 |
| 1982 | 3835 | 61 | 1590.61 |
| 1983 | 4532 | 59 | 1301.85 |
| 1984 | 4576 | 51 | 1114.51 |
| 1985 | 4243 | 55 | 1296.25 |
| 1986 | 4592 | 63 | 1415.50 |
| 1987 | 4721 | 53 | 1122.64 |
| 1988 | 5247 | 57 | 1086.33 |
| 1989 | 5184 | 59 | 1138.11 |
| 1990 | 5865 | 64 | 1091.21 |
| 1991 | 4903 | 60 | 1223.74 |
| 1992 | 5908 | 99 | 1675.69 |
| 1993 | 4887 | 83 | 1698.38 |
| 1994 | 4941 | 61 | 1234.56 |
| 1995 | 4987 | 58 | 1163.02 |
| 1996 | 4962 | 35 | 705.36 |
| Total | 104649 | 1516 | 1448.65 |

Table II
Causes of Maternal deaths in percentage

| | Direct Causes | | | | | | | | | | Indirect Causes | | | | Others | | |
|------|---------------|------|-------|---------------------|-------------|--------------|----------------|----------------|-------------------|----------|-----------------|----------|------------|------|--------------|---------|-------------|
| | Haemorrhage | APH | PPH | Toxaemia, Eclampsia | Septicaemia | Post abortal | Post puerperal | Rupture uterus | Ectopic pregnancy | Embolism | Anaemia | Jaundice | Heart Dis. | DIC | Encephalitis | Malaria | Transfusion |
| 1975 | 15.15 | 6.06 | 9.09 | 18.18 | 14.19 | 11.12 | 3.07 | 2.02 | 1.01 | 1.01 | 38.38 | 7.07 | 1.01 | 1.01 | | | |
| 1980 | 10.84 | 6.02 | 4.82 | 31.32 | 12.04 | 8.43 | 3.61 | 2.41 | 1.20 | | 36.14 | 2.41 | | | | | 2.41 |
| 1985 | 14.28 | 3.57 | 10.71 | 19.64 | 19.61 | 12.50 | 7.14 | 5.36 | 1.78 | | 21.43 | 3.56 | 1.78 | 1.78 | 5.36 | 1.78 | |
| 1990 | 16.38 | 6.55 | 9.83 | 27.87 | 11.47 | 6.55 | 4.92 | 1.63 | 1.63 | 1.63 | 9.68 | 4.92 | 1.63 | | 1.63 | 1.63 | 1.63 |
| 1995 | 20.69 | 8.62 | 12.07 | 32.76 | 8.62 | 3.45 | 5.17 | 1.72 | | | 27.58 | 3.45 | 1.72 | | 3.45 | | |
| 1996 | 25.71 | 5.71 | 20.00 | 22.85 | 11.42 | 8.57 | 2.85 | 2.85 | | 2.85 | 20.00 | 8.57 | 2.85 | | 2.85 | | |

Table II shows the causes of maternal deaths in percentage in the last 26 yrs. It is evident that major causes of maternal deaths have remained more or less the same through the years. Direct causes like eclampsia, septicaemia, haemorrhage & indirect causes like anaemia have been responsible for maximum number of maternal deaths every year. Though percentage of deaths due to anaemia have reduced over the years because of universal provision of iron and folic acid prophylaxis, eclampsia & haemorrhages still lead.

Table III shows the percentage of booked & unbooked cases in maternal deaths from 1991 to 1996. Even in the last decade of 20th century, 85 to 90% of maternal deaths were of unbooked cases.

Table IV shows that more than 60% maternal deaths from 1991 to 1996 were from rural areas.

Discussion

Table V shows comparative MMR & percentage of causes of death in some institutions in India. MMR is higher in our hospital because of large numbers of unbooked cases and a data collected over 26 yrs. Patients often reach the hospital in terminal & irreversible conditions. Major causes of deaths are similar in all institutions depicted in table V. Eclampsia, septicaemia, haemorrhage and anemia can be prevented and avoided

Table III
Percentage of booked & unbooked cases in maternal deaths

| Year | Total Deaths | Booked cases | unbooked cases |
|------|--------------|--------------|----------------|
| 1991 | 60 | 4 (6.66%) | 56 (93.44%) |
| 1992 | 99 | 10 (10.10%) | 89 (89.90%) |
| 1993 | 83 | 5 (6.02%) | 78 (93.98%) |
| 1994 | 61 | 8 (13.11%) | 53 (86.89%) |
| 1995 | 58 | 3 (5.17%) | 55 (94.83%) |
| 1996 | 35 | 5 (14.28%) | 30 (85.72%) |

Table IV
Maternal deaths from urban & rural areas

| Year | Total No. of deaths | Urban | Rural |
|------|---------------------|-------------|-------------|
| 1991 | 60 | 14 (23.33%) | 46 (76.67%) |
| 1992 | 99 | 39 (39.39%) | 60 (60.61%) |
| 1993 | 83 | 37 (44.58%) | 46 (55.42%) |
| 1994 | 61 | 24 (39.34%) | 37 (60.66%) |
| 1995 | 58 | 28 (48.27%) | 30 (51.72%) |
| 1996 | 35 | 10 (28.57%) | 25 (71.43%) |

Table V
Comparative MMR at different institutions in India

| Institution | Year | MMR | Causes in percentage | | | | |
|--|---------|---------|----------------------|----------|--------|---------|----------|
| | | | Hge | Toxaemia | Sepsis | Anaemia | Jaundice |
| Roy Choudhury et al Safdarjung hospital New. Delhi, 1990 | 1979-87 | 638 | 18.1 | 12.72 | 23.2 | 13.7 | 16.8 |
| Bara & Sengupta Eden Hospital Medical College, Calcutta 1991 | 1979-80 | 1009 | 23.8 | 17.9 | 19.9 | 15.2 | 5.9 |
| Ramteke & pajai VNGMC Yavatmal 1995 | 1992-94 | 1048.24 | 29.25 | 12.93 | 12.24 | 12.93 | 5.4 |
| Present study Joshi & Sapre KRH Gwalior | 1971-96 | 1448.65 | 17.17 | 25.44 | 12.89 | 28.87 | 4.99 |

Maternal Mortality Rate per Year

to a large extent by proper antenatal & intra natal care, early detection of complications and efficient emergency services.

Very high percentage of unbooked patients in maternal deaths highlights the importance of adequate antenatal care in avoiding maternal deaths. On the other hand it depicts the inefficiency in utilization of the health care facilities by a majority of our population. The largest proportion of our population resides in remote rural areas. Many maternal deaths occur due to lack of awareness for and unavailability of adequate antenatal care, delayed referral and lack of transport facilities.

Conclusion:

Reviewing maternal deaths over last 26 yrs, it is evident that better hospital care & health care facilities have helped in reducing the MMR from 1970s to 1980s but further reduction requires carrying essential obstetric care to the remote and rural areas. Involving media to increase awareness for maternal health amongst the ignorant & illiterate rural population may go a long way in improving utilization of present health care system. Provision of

transport facility is a must to the smallest unit of health service and referral district hospitals must be equipped with blood transfusion facilities anaesthesia, paediatric care along with proper instruments & trained paramedical staff. This will not only reduce burden on apex hospitals but also save precious time & money for the rural unprivileged and complicated mothers.

Widespread propaganda about medicare, increase in numbers of trained personnels at periphery, prompt transportation facilities, improved sanitation adequate blood transfusion facilities and proper utilization of existing MCH services seem to be the cardinal requirements of the day which are not so costly and difficult.
